

App Summary - gomoku_game

Repo-evidence summary

Scope note: the repo root is a multi-project workspace. This summary covers the clearest standalone app folder found in the repo: gomoku_game.

WHAT IT IS

A standalone browser-based Gomoku game built with plain HTML, CSS, and JavaScript. It runs entirely on the client and keeps game state in memory.

WHO IT'S FOR

Two local players who want a lightweight 15x15 Gomoku game in a browser. It also fits developers looking for a small vanilla-JS example with separated UI and game logic.

WHAT IT DOES

- 15x15 board rendered as a clickable grid.
- Two-player local play with alternating black and white turns.
- Occupied cells are blocked from being reused.
- Win detection across horizontal, vertical, and both diagonal lines.
- Draw detection when the board is full with no winner.
- Restart control resets UI state and in-memory board state.
- Responsive styling and simple hover/slide-in visual feedback.

HOW IT WORKS

- `index.html` defines the shell: title, current-player label, restart button, board container, and result area.
- `game.js` is the controller. It creates `Board` and `GameLogic`, binds click/restart events, tracks turns, and ends the game.
- `board.js` owns DOM rendering. It creates 225 cells, maps row/col through `data-*` attributes, and paints stones with CSS classes.
- `gameLogic.js` owns rules and state. It stores a 15x15 in-memory array, places stones, checks four directions, and detects full-board draws.
- `style.css` provides layout, piece styling, hover states, animation, and a mobile adjustment for smaller screens.
- Data flow: user click -> `game.js` handler -> `gameLogic.js` state update/checks -> `board.js` DOM update -> result/current-player text refresh.
- Backend, API, database, auth, and persistence layers: Not found in repo.

HOW TO RUN

- Open `gomoku_game/index.html` directly in a browser.
- Or from `gomoku_game/`, run `python -m http.server 8000` and open `http://localhost:8000`.
- Install/build steps inside `gomoku_game`: Not found in repo.
